Sequence 3, Application US/08463092B
Patent No. 5766880
GENERAL INFORMATION:
APPLICANT: Cole, Susan P.C.
APPLICANT: Deeley, Roger G.
TITLE OF INVENTION: ISOLATED NUCLEIC ACID MOLECULES ENCODING
TITLE OF INVENTION: MULTIDRUG RESISTANCE PROTEINS
NUMBER OF SEQUENCES: 9
CORRESPONDENCE ADDRESS:
ADDRESSEE: PAREQ RESEARCH & DEVELOPMENT INNOVATIONS
STREET: Queen's University at Kingston

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                           Sequence 3,

Patent No. 5882875
GENERAL INFORMATION:
APPLICANT: Cole, Susan P.C.
APPLICANT: Deeley, Roger G.
TITLE OF INVENTION: METHODS FOR IDENTIFYING
TITLE OF INVENTION: MULTIDRUG RESISTANT TUMOR CELLS
MINDER OF SEQUENCES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC COMPATIBLE
OPPRATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: ASCII text

The present sequence encodes a human MPR-related ABC transporter (MOAT) protein, designated MOAT-E. The protein comprises a multi-domain structure including a tandem repeat of nucleotide binding folds appended C-terminal to a hydrophobic domain, having Walker A and B ATP binding sites and several potential membrane spanning domains. The MOAT nucleic acids are useful for screening a test compound for inhibition of MOAT mediated transport, indicated by restoration of anticancer drug sensitivity, which in turn causes a reduction of transporter mediated cellular efflux of anticancer agents. MOAT DNA or RNA may be used as probes to detect the presence or expression of genes encoding MOAT proteins. Anti-MOAT antibodies are useful for detecting and quantitating
                                                                                                                                                                                                          for anti-cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 4509 BP; 833 A; 1385 C; 1353 G; 938 T; 0 other;

Screening presence of Pseudoxanthoma elasticum mutation useful for identifying homozygotes, compound heterozygotes or carriers involves determining presence of mutation in MRP6 (ABCC6) nucleic acid

Example 2; Page 130-137; 163pp; English.

treating Pseudoxanthoma elasticum (PKE) and PKE associated physiological dysfunctions. The invention is useful for screening for the presence of a PKE mutation. Mutations associated with PKE maps to the ArP-binding cassette transporter ABCC6 (MRP6) with PKE maps to the ArP-binding cassette transporter ABCC6 (MRP6) and presence of protein 6) gene locus on chromosome 16. ABCC6 (MRP6) gene encodes a 165 protein 10 forated in the plasma membrane containing 17 membrane. Spanning helices grouped into three transmembrane domains. PKE is inherited as an autosomal recessive phenotype or appears as a sporadic clastic fibers is a heritable disorder characterised by mineralisation of elastic fibers in skin, arteries and the retina, that result in dermal lesions with associated laxity and loss of elasticity, arterial macular degeneration. The method is useful for screening a population of individuals in order to identify individuals with one or more PKE individuals in order to identify individuals with appropriate genetic counselling in view of the PKE status. The methods are useful for identifying homozygotes, compound heterozygotes or carriers and thus are useful in the area of genetic testing, carrier detection and prenatal dagnanosis. The present CDNA sequence encodes human ATP-binding cassette (ABC) transporter, ABCC6 (MRP6) protein belonging to sub-family "C". Since ABCC6 protein is involved in drug-resistance it is also called Multidrug Resistance associated protein 6 (MRP6). The invention relates to methods and compositions for diagnosing and

Human, prenatal diagnosis, dermal lesion, cardiovascular disease, MRP6, whilidorg Resistance-associated protein 6; macular degeneration, ABCC6; ATP-binding cassette transporter; arterial insufficiency; chromosome 16; Pseudoxanthoma elasticum; PXE; heritable disorder; retinal haemorrhage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to methods and compositions for diagnosing and treating Pseudoxanthoma elasticum (PXE) and PXE associated physiological dysfunctions. The invention is useful for screening for the presence of a PXE mutation. Mutations associated with PXE maps to the ATP-binding associate transporter ARCG (MRP6-Multidrug Resistance associated protein-6) gene locus on chromome 16. ABCG6 (MRP6) gene encodes a 165 kDa protein located in the plasma membrane containing 17 membrane.
                                                                                                                                                              4440
                                                                                                                                                                                                              4500
                                                                                                                                                                                                                                                                       4500
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening presence of Pseudoxanthoma elasticum mutation useful for identifying homozygotes, compound heterozygotes or carriers involves determining presence of mutation in MRP6 (ABCC6) nucleic acid

ω

comming helices grouped into three transmembrane domains. PXE is inherited as an autosomal recessive phenotype or appears as a sporadic phenotype. PXE is a heritable disorder characterised by mineralisation of elastic fibers in skin, arteries and the retina, that result in dermal lesions with associated laxity and loss of elasticity, arterial lemant adsequention. The method is useful for screening a population of macular degeneration. The method is useful for screening a population of individuals in order to identify individuals with one or more PXE associated MRPG allels who are then provided with appropriate genetic counselling in view of the PXE status. The methods are useful for identifying homozygotes, compound heterozygotes or carriers and thus are useful in the area of genetic testing, carrier detection and prenatal diagnosis. The present sequence is human ATP-binding cassette (ABC) transporter, ABCC6 (MRP6) mutant cDNA. This mutant cDNA results in an amino acid change from Arg to Pro at position 1114 of MRP6 protein.

Note: The present sequence is not shown in the specification but is derived from human ATP-binding cassette transporter ABCC6 (MRP6) cDNA (SED ID NO: 2) shown in page 130-137 of the specification (AAD16231). 55555555555555555555558888

treating Pseudoxanthoma elasticum (PXE) and PXE associated physiological dysfunctions. The invention is useful for screening for the presence of a PXE mutation. Mutations associated with PXE maps to the APP-binding cassette transporter ABCC6 (MRP6) with PXE maps to the APP-binding cassette transporter ABCC6 (MRP6) with PXE maps to the APP-binding cassette transporter ABCC6 (MRP6) gene encodes a 165 protein 6) gene locus on chromosome 16. ABCC6 (MRP6) gene encodes a 165 concerned in the plasma membrane containing 17 membrane. Spanning helices grouped into three transmembrane domains. PXE is inherited as an autosomal recessive phenotype or appears as a sporadic characterised by mineralisation of elastic fibers in skin, arteries and the retina, that result in dermal consular degeneration. The method is of elasticity, arterial consular degeneration. The method is useful for screening a population of individuals in order to identify individuals with one or more PXE individuals. In order to identify individuals with appropriate genetic counselling in view of the PXE status. The methods are useful for deartifying homozygotes, compound heterozygotes or carriers and thus are cuseful in the area of genetic testing, carrier detection and prenatal classporter. ABCC6 (MRP6) mutant colm. This mutant colm assette (ABC) cransporter. ABCC6 (MRP6) mutant colm the specification but is amino acid change from Ary to Gln at position 1138 of MRP6 protein. Note: The present sequence is not shown in the specification but is derived from human ATP-binding cassette transporter ABCC6 (MRP6) such and present sequence is not shown in the specification but is contracted from human ATP-binding cassette transporter ABCC6 (MRP6) contained to the present sequence is not shown in the specification but is sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CCCATGTACCTCTGGGTCCTTGGTCCCATCTACCTCTTCATCCACCACCATGGCCGG 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240

The invention relates to methods and compositions for diagnosing and treating Pseudoxanthoma elasticum (PXE) and PXE associated physiological dysfunctions. The invention is useful for screening for the presence of a PXE mutation. Mutations associated with PXE maps to the ATP-binding cassette transporter ABCC6 (MRP6-Multidrug Resistance associated cassette transporter ABCC6 (MRP6-Multidrug Resistance associated cassette transporter ABCC6 (MRP6-Multidrug Resistance associated codes a 165 cassette transporter ABCC6 (MRP6-Multidrug Resistance associated codes a 165 cassenting helices grouped into three transmembrane domains. PXE is therited as an autosomal recessive phenotype or appears as a sporadic phenotype. PXE is a heritable disorder characterised by mineralisation of elastic fibers in skin, arteries and the retina, that result in dermal cassociated laxity and loss of elasticity, arterial insulficiency, cardiovascular disease and retinal haemorrhages leading to macular degeneration. The method is useful for screening a population of individuals in order to identify individuals with one or more PXE associated MRP6 alleles who are then provided with appropriate genetic counselling in view of the PXE status. The methods are useful for counselling in view of the PXE status. The methods are useful for custing the area of genetic testing, carrier detection and prenatal diagnosis. The present sequence is human APP-binding cassette (ABC) transportar, ABCC6 (MRP6) mutant cDNA. This mutant cDNA results in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cassette transporter ABCC6 (MRP6) cDNA 30-137 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening presence of Pseudoxanthoma elasticum mutation useful for identifying homozygotes, compound heterozygotes or carriers involves determining presence of mutation in MRP6 (ABCC6) nucleic acid
                                                                                                                                                                                               form

treating Pseudoxanthoma elasticum (PXE) and PXE associated physiological dysfunctions. The invention is useful for screening for the presence of a PXE mutation. Mutation is useful for screening for the presence of associated transporter ABCC6 (MRP6-Multidrug Resistance associated physiological cassette transporter ABCC6 (MRP6-Multidrug Resistance associated protein-6) gene locus on chromosome 16. ABCC6 (MRP6) gene encodes a 165 protein-6) gene locus on chromosome 16. ABCC6 (MRP6) gene encodes a 165 protein located in the plasma membrane containing 17 membrane-spanning helices grouped into three transmembrane domains. PXE is therrited as an autosomal recessive phenotype or appears as a sporadic phenotype. PXE is a heritable disorder characterised by mineralisation of clastic fibers in skin, arterises and the retina, that result in dermal lesions with associated laxity and loss of elasticity, arterial lesions with associated laxity and loss of elasticity, arterial concluded acqueration. The method is useful for screening a population of individuals in order to identify individuals with one or more PXE associated MRP6 alleles who are then provided with appropriate genetic counselling in view of the PXE status. The methods are useful for lefentifying homozygotes, compound heterozygotes or carriers and thus are
                                                                                                                                                                                                                                                                                                               Human, prenatal diagnosis, dermal lesion; cardiovascular disease, MRP6, Multidrug Resistance-associated protein 6; macular degeneration; ABCC6, ATP-binding cassette transporter; arterial insufficiency; chromosome 16, Pseudoxanthoma elasticum; PXE; heritable disorder; retinal haemorrhage;

```

useful in the area of genetic testing, carrier detection and prenatal diagnosis. The present sequence is human ATP-binding cassette (ABC) transporter, ABCC6 (MRP6) mutant cDNA. This mutant cDNA results in an amino acid change from Val to Phe at position 1298 of MRP6 protein. Note: The present sequence is not shown in the specification but is derived from human ATP-binding cassette transporter ABCC6 (MRP6) cDNA (SED ID NO: 2] shown in page 130-137 of the specification (AAD16231). 8

The present sequence is human ATP-binding cassette (ABC) transporter, ABCC6 (MRP6) mutant cDNA. This mutant cDNA results in an amino acid change from Gly to Arg at position 1302 of MRP6 protein. Note: The present sequence is not shown in the specification but is derived from human ATP-binding cassette transporter ABCC6 (MRP6) cDNA [SED ID NO: 2] shown in page 130-137 of the specification (AAD16231).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                480

```
The invention relates to methods and compositions for diagnosing and treating Pseudoxanthoma elasticum (PXE) and PXE associated physiological dysfunctions. The invention is useful for screening for the presence of a PXE mutation. Mutations associated with PXE maps to the ATP-binding cassette transporter ABCC6 (MRD6-MILLIdruy Resistance associated of protein-6) gene locus on chromosome 16. ABCC6 (MRP6) gene encodes a 165 cm protein located in the plasma membrane containing 17 membrane. Spanning helices grouped into three transmembrane domains. PXE is conherited as an autosomal recessive phenotype or appears as a sporadic phenotype. PXE is a heritable disorder relaracterised by mineralisation of elastic fibers in skin, arteries and the retina, that result in dermal insufficiency, cardiovascular disease and retinal haemorrhages leading to macular degeneration. The method is useful for screening a population of individuals in order to identify individuals with one or more PXE associated MRP6 alleles who are then provided with appropriate genetic counselling in view of the PXE status. The methods are useful for cuseful in the area of genetic testing, carriers and thus are useful in the area of genetic testing, carrier detection and prenatal cuseful in the area of genetic testing, carrier detection and prenatal cuseful in the area of genetic testing, carrier detection and prenatal cuseful in the present sequence is human ATP-Dinding cassette (ABC) amino acid change from Ala to Pro at position 1303 of MRP6 protein.

Counselling manner and are provided with appropriate on an animal and prenatal conference from human ATP-Dinding cassette (ABC) (MRP6) mutant cDNA, This mutant cDNA results in an animal and prenate sequence is not shown in the specification but is conference in the present sequence is not shown in the specification but is conference to the present sequence is not shown in the specification but is conference to the present sequence is not shown in the specification but is conference to the present sequence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       identifying homozygotes, compound heterozygotes or carriers involves determining presence of mutation in MRP6 (ABCC6) nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                        Screening presence of Pseudoxanthoma elasticum mutation useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NO: 2] shown in page 130-137 of the specification

The invention relates to methods and compositions for diagnosing and treating Pseudoxanthoma elasticum (PXE) and PXE associated physiological dysfunctions. The invention is useful for screening for the presence of a PXE mutation. Mutations associated with PXE maps to the ATP-binding cassette transporter ABCC6 (MRP6-Multidrug Resistance associated protein located in the plasma membrane containing 17 membrane. Spanning helices grouped into three transmembrane domains. PXE is a heritable disorder characterised by mineralisation of elastic fibers is a heritable disorder characterised by mineralisation of elastic fibers in skin, arteries and the retina, that result in dermal lesions with associated laxity and loss of elasticity, arterial insufficiency, cardiovascular disease and retinal hemorrhages leading to macular degeneration. The method is useful for screening a population of individuals in order to identify individuals with appropriate genetic connealing in view of the PXE status. The methods are useful for identifying homozygotes, compound heterozygotes or carriers and thus are useful in the area of genetic testing, carrier detection and prenatal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

This mutant cDNA results in an amino acid change from Arg to Trp at position 1314 of MRP6 protein. Note: The present sequence is not shown in the specification but is derived from human ATP-binding cassette transporter ABCCG (MRP6) cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Screening presence of Pseudoxanthoma elasticum mutation useful for identifying homozygotes, compound heterozygotes or carriers involves determining presence of mutation in MRP6 (ABCC6) nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2] shown in page 130-137 of the specification (AAD16231).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
